NEUROINSIGHT AI RADIOLOGY REPORT

==

Scan ID : MRI-2026-88730

Date/Time : 31 May 2026 | 04:06 PM

==

1. MRI VALIDATION

==

Result:

Valid Brain MRI Scan

Validation Confidence:

99.81%

==

MRI IMAGE QUALITY ANALYSIS

==

Image Resolution:

256x256

Contrast Quality:

Normal

Noise Level:

Low

Artifacts:

No significant imaging artifacts detected.

Image Assessment:

MRI quality is sufficient for AI-based analysis.

==

2. TUMOR CLASSIFICATION

==

Detection Result:

Tumor Detected

Tumor Type:

Meningioma

Model Confidence:

91.05%

Confidence Interpretation:

High Confidence

==

3. TUMOR SEGMENTATION ANALYSIS

==

Affected Brain Region:

2.30%

Tumor Area:

1506 pixels

Severity:

Mild

Location:

[97.42430278884463, 62.48406374501992]

Bounding Box:

[44, 42]

SHAPE ANALYSIS

ECCENTRICITY:

0.384

Description:

Mildly elongated

Interpretation:

Moderate eccentricity

SOLIDITY:

0.979

Description:

Compact and convex

Interpretation:

High solidity - well-defined margin

Shape Risk:

LOW SHAPE RISK - Compact regular morphology.

Segmentation Observation:

A moderate segmented lesion occupying 2.30% of the brain region was identified. The lesion appears compact and convex with mildly elongated morphology located near X=97.4, Y=62.5.

TUMOR BEHAVIOR ANALYSIS

Growth Pattern:

Localized and compact

Morphological Nature:

Likely benign morphology

Boundary Characteristics:

Well-defined tumor margins

==

EXPLAINABLE AI ANALYSIS

==

Grad-CAM Visualization:

Activated

Observation:

The AI model focused primarily on abnormal
high-intensity lesion regions during prediction.

Interpretability Assessment:
The highlighted activation regions are consistent
with segmented tumor localization.

Clinical Relevance:
Grad-CAM improves transparency by explaining
which MRI regions influenced the AI prediction.

==
4. TUMOR PROFILE
==

Description:
Usually benign extra-axial brain tumor arising from meninges.

Characteristics:
- Well-defined margins
- Slow-growing
- Extra-axial lesion

==
5. RISK ASSESSMENT
==

Risk Level:
LOW RISK

Clinical Severity Interpretation:
Moderate tumor burden observed

Suggested Action:
Specialist consultation recommended.

Prognostic Indicator:
Favorable prognosis likely with monitoring

==
6. AI MEDICAL SUMMARY

==

MRI findings suggest meningioma with localized tumor involvement.

==

FINAL RADIOLOGY IMPRESSION

==

Findings are suggestive of Meningioma with approximately 2.30% regional involvement.

Overall Assessment:

Routine monitoring advised.

==

7. RECOMMENDATIONS

==

1. Neurology consultation recommended
2. Periodic MRI follow-up advised
3. Monitor tumor growth progression

==

AI TECHNICAL ANALYSIS

==

Primary Classification Model:

ResNet50 CNN

Segmentation Architecture:

U-Net Deep Learning Network

Inference Pipeline:

MRI Validation → Tumor Classification → Segmentation

AI Decision Support:

Enabled

Explainable AI:

Grad-CAM Integrated

Report Generation:

Automated AI-assisted radiology workflow

==
SYSTEM RELIABILITY
==

Classification Confidence:
91.05%

Segmentation Reliability:
High

AI Consistency:
Prediction confidence and segmentation findings
show strong agreement.

==
8. DISCLAIMER
==

This report is AI-generated and intended for
educational/research purposes only.

Final diagnosis must always be confirmed
by qualified medical professionals.

==
END OF REPORT
